Leveraging Open-Source Large-Language Model-Enabled Identification of Undiagnosed Patients with Rare Genetic Aortopathies

Pankhuri Singhal*, Zilinghan Li*, Ze Yang*, Tarak Nandi, Zachary Rodriguez, Theodore Drivas, Alexis Rodriguez, Ravi Madduri*, Anurag Verma*

Speaker: Zilinghan Li, Machine Learning Engineer, Argonne

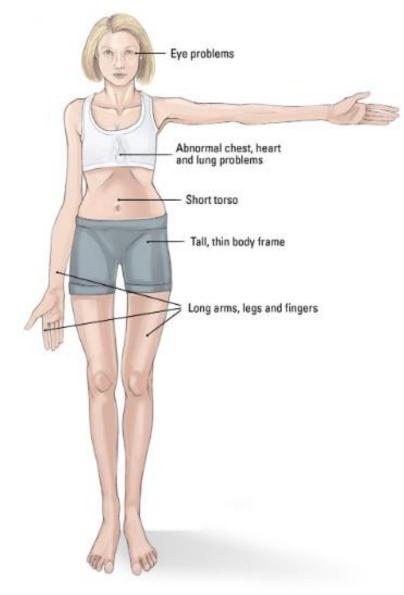

DISCLOSURE OF CONFLICTS OF INTEREST

I have not had any relationships with ACCME-defined ineligible companies within the past 24 months.

MOTIVATION

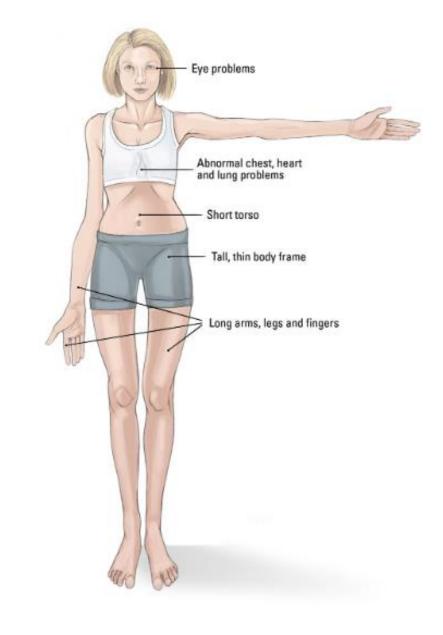

- Rare genetic syndromes, hereditary aortopathies in particular, are difficult to diagnose due to high phenotypic heterogeneity – not everyone presents the same way.
- Example syndromes: Marfan's, Loeys-Dietz, Turner, etc.
- If diagnosis is delayed until symptoms appear, certain damages or complications might become irreversible, reducing treatment effectiveness.
- Undiagnosed patients often experience fatal aortic dissection and rupture, which might lead to death.

MOTIVATION

- Some rare diseases can be detected earlier if genetic testing is done, enabling early proactive interventions.
- However, many physicians receive minimal training to refer genetic testing for patients.

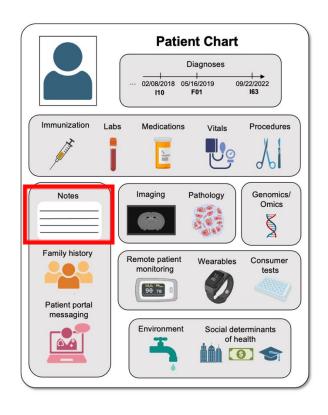

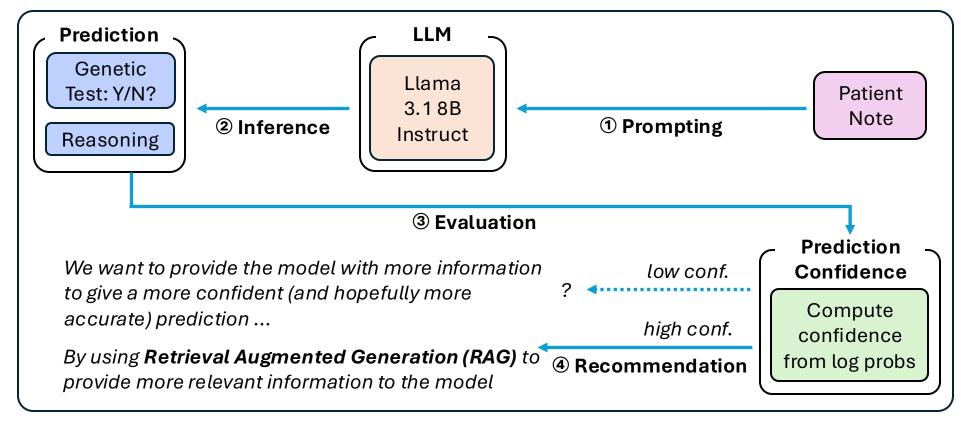

PROBLEM DESCRIPTION

- Free-text clinical notes contain observations and narratives regarding a patient's health history that can serve as evidence to support recommendations for genetic testing.
- Nowadays, Large Language Models (LLMs) have become very powerful at knowledge distillation and understanding.

Goal: Can LLMs help identify undiagnosed patients in an early screening stage by recommending patients for genetic testing? And finally make it an impactful end-to-end pipeline integrated into clinical settings?

PIPELINES

Rare Disease Al-Recommendation Pipeline

* We chose Llama3.1 8B as it is open-source, portable, supports long-context window (up to 128k tokens), and provides great performance in our initial testing.

QUICK SIDE NOTE

What is Retrieval Augmented Generation (RAG)?

do you think the weather today is suitable for tennis?

< 2/2 >

Retrieve relevant information from external database to

Augment the user prompt to assist the Generation

do you think the weather today is suitable for tennis?

Here are some weather information I have for my city: Cloudy and windy with periods of rain. High 61F. Winds SSE at 20 to 30 mph. Chance of rain 100%. Winds could occasionally gust over 40 mph.

< 3/3 >

I can't check real-time weather data directly. Could you let me know where you are or check the current weather conditions in your area? Look for mild temperatures, low wind, and no rain for the best tennis conditions!

No RAG

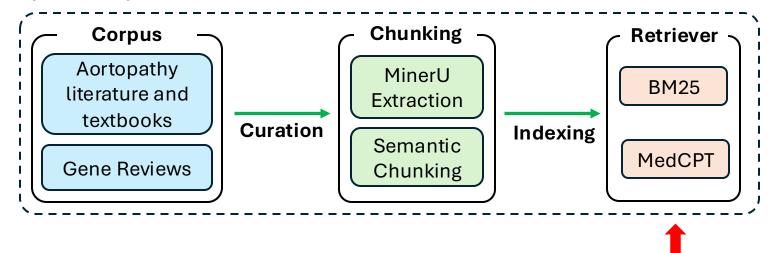

The weather conditions you described — cloudy, windy, with heavy rain and strong gusts — aren't ideal for playing tennis. The strong winds and rain can affect your ability to play effectively and may even make it unsafe, especially with winds gusting over 40 mph. It might be a better day for indoor activities instead!

With RAG

PIPELINES

(External) Database Creation

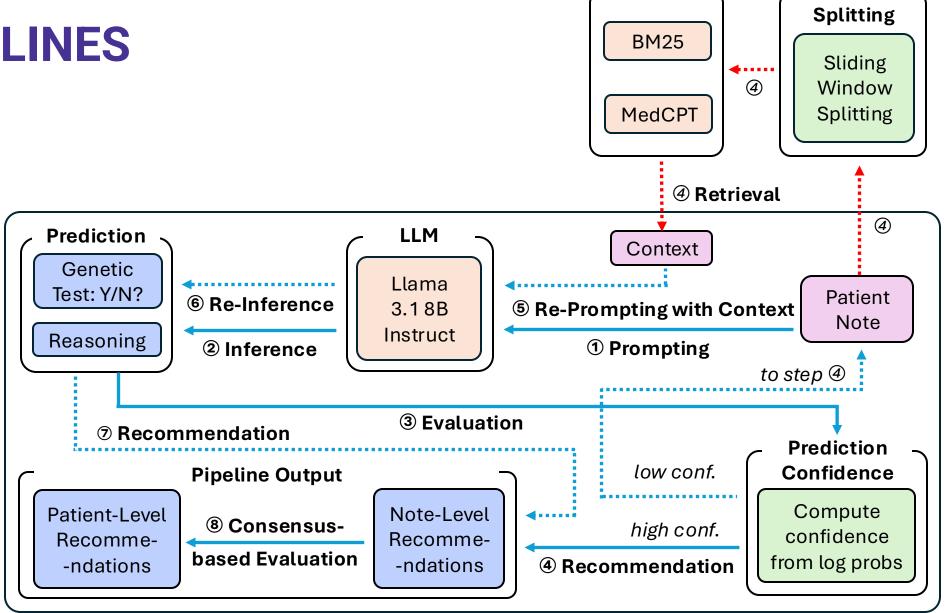

A "dictionary" that can be queried for relevant text chunks.

For example:

Marfan syndrome (MIM 154700) is a panethnic, autosomal dominant, connective tissue disorder that results from mutations in the fibrillin 1 gene (FBN1, MIM 134797). This syndrome has an incidence of approximately 1 in 5000. Approximately \$25\%\$ to \$35\%\$ of patients have de novo mutations. Mutations leading to Marfan syndrome are scattered across the gene, and each mutation is usually unique to a family...

PIPELINES

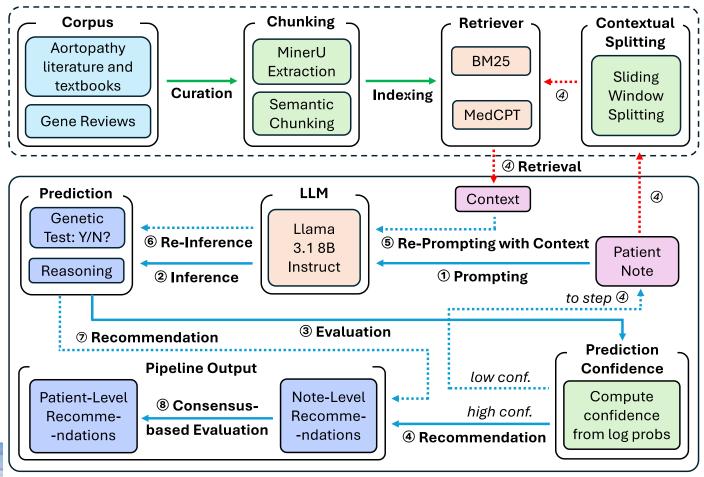

Retriever

Contextual

Rare Disease Al-Recommendation Pipeline

PIPELINES - SUMMARY

A. Vector Database Creation & Relevant Context Retrieval

B. Rare Disease Al-Recommendation Pipeline

Pipeline Steps:

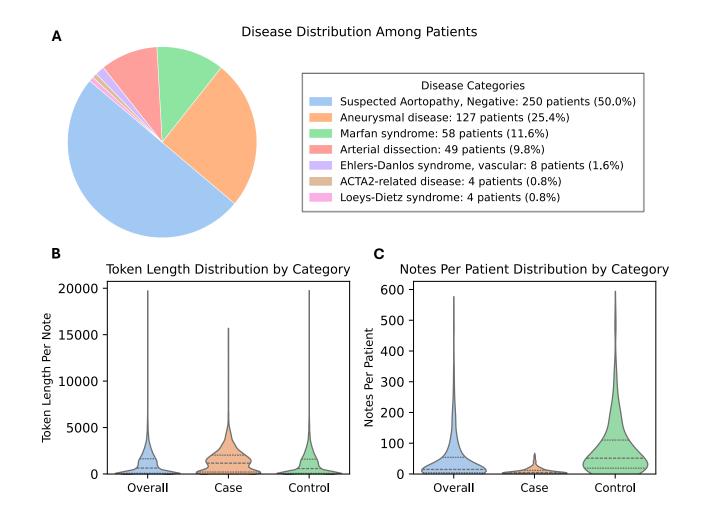

- Leverage open-source base LLM to make recommendations per note
- 2) Confidence check based on output probability to identify low-confidence recommendations
- 3) Leverage RAG on aortopathy literature to make recommendations on low-confidence notes
- 4) Evaluation across all notes of each individual patient to generate final patient-level recommendation

The pipeline is reusable – it can be reconfigured and repurposed for any disease area.

EXPERIMENTS - SETTINGS

- Data: Real patient notes from Penn Medicine Bio Bank
 - 250 cases (individuals referred for genetic testing),
 250 controls (no genetic diagnoses, never referred for genetic testing)
 - All progress notes from last 5 years – 20,720 notes

EXPERIMENTS - SETTINGS

- **Domain specific knowledge corpus**: disease-specific clinical guidelines, textbooks, and literature (open-source) corpus integrated using retrieval augmentation generation
- **Model**: tested many open-source models such as llama2, llama3, llama3.1, mistral, etc. and we finally decide to go with llama3.1-8B-Instruct
- Compute Environment: The pipeline is running on a secure environment approved by Penn Medicine on Databricks.

EXPERIMENTS - PROMPT

- Prompt is important! It guides the model's response by setting the context, scope, and intent of the output.
- A well-crafted prompt is the key to improving the usefulness and accuracy of an LLM's output.

You are a clinical expert on rare genetic diseases, with a specialization in genetic aortopathic conditions such as Marfan syndrome, Loeys-Dietz syndrome, and similar disorders. Your task is to determine if this patient needs genetic testing specifically for aortopathic genetic diseases based on their past and present symptoms and medical history.

Please follow these guidelines:

- 1) Consider only symptoms and medical history related to genetic aortopathic conditions.
- 2) If the patient shows signs that suggest an genetic aortopathic disease, recommend testing and provide specific criteria why.
- 3) If the patient does not show signs specific to genetic aortopathic diseases, state why genetic testing for these conditions is not recommended.

Return your response as a JSON formatted string with 2 parts:

- 1) testing recommendation {'testing':'recommended'} or {'testing':'not
 recommended'}
- 2) your reasoning, focused solely on genetic aortopathic conditions

EXPERIMENTS - PROMPT

General guidelines: role description, and the overall expectations.

- 2) your reasoning, focused solely on genetic aortopathic conditions

EXPERIMENTS – MAIN RESULTS

Base Accuracy: 0.8457 Base Precision: 0.8945

Base Recall: 0.7831

Base F1 Score: 0.8351

Base F3 Score: 0.7930

Final Accuracy: 0.8497

Final Precision: 0.8884

Final Recall: 0.7992

Final F1 Score: 0.8414

Final F3 Score: 0.8073

Accuracy: +0.47%

Precision: -0.68%

Recall: +2.05%

F1 Score: +0.76%

F3 Score: +1.80%

Pipeline Results **without** Re-run on Low Confidence Notes

Pipeline Results **with** Re-run on Low Confidence Notes

EXPERIMENTS - INTERPRETABILITY

We built a model interpretability pipeline to ensure recommendations are grounded in meaningful clinical evidence – we show how LLM "pays attention to" different input parts to generate its output.

* The note used in this example is synthetic to avoid leaking any patient privacy.

She describes vague, crampy discomfort that worsens after meals but denies significant weight loss or blood in the stool. Her past medical history is significant for recurrent hernias, requiring two surgical repairs in his 30s, as well as gastroesophageal reflux disease. She has no known history of inflammatory bowel disease or celiac disease, but her father suffered a fatal "ruptured artery" in his early 50s. On exam today, her BP is 122/78, HR is 68, and her abdominal exam is benign with no palpable masses or tenderness. Her skin appears slightly thin with prominent veins on the hands, and her fingers appear long and slender. Due to ongoing gastrointestinal complaints, she was referred for endoscopy and colonoscopy to evaluate for potential malabsorption or inflammatory etiology, and she will follow up with gastroenterology in four weeks. **Input Attributions**

CONCLUSION AND FUTURE WORK

- An end-to-end LLM-based genetic test recommendation pipeline.
- Pipeline is scalable, portable, and generalizable, enabling easy adaptation to other disease prediction and early screening tasks.
- While Llama-3.1-8B-Instruct demonstrates feasibility, ongoing advances in open-source and proprietary LLMs promise further accuracy improvements.
- Future work involves integration with EHR systems to maximize clinical impact.

Thank you!
